Project Overview

Introduction

This document provides an overview of our Web Development project, where the group will create a website for LK Bakery, a local bakery specializing in pastries and drinks. This project helps us practice and improve our web development skills by building a website for a real business.

The project includes several important steps, such as:

- Finding a business that will let us use their name and logo
- Talking to the business owner to understand what they want for the website
- Looking at the bakery's current online presence to see what's good and what can be improved
- Planning how we will build the website
- Designing a look for the website that is both attractive and easy to use
- Creating and finishing a website that meets the bakery's needs

The website will be designed for customers who want to learn more about LK Bakery, view their menu, and place orders online. The goal is to build a simple and effective website that improves the bakery's online presence and makes it easier for customers to interact with them.

The group will implement technologies like HTML, CSS, and JavaScript to create the website.

This project will not only help us build a website but also give us a chance to face real challenges, such as creating an appealing design and making sure the site works well for visitors. The business will have the choice to take the website public or not.

LK Bakery serves pastries like croissants and pain au chocolat, and drinks such as coffee, matcha, and tea. The business has been operating since May of 2024, and has garnered a commendable reputation for having creative yet delicious baked goods.

1.1 The Problem of the Business

LK Bakery faces significant challenges due to its lack of an online presence, limiting brand awareness and customer reach. Without a dedicated website, the bakery struggles to effectively communicate its commitment to high-quality ingredients and its mission of making premium pastries accessible. This absence also results in missed opportunities for online sales, as customers increasingly prefer the convenience of digital transactions. Additionally, the lack of a centralized platform hinders customer engagement, making it difficult to share updates, gather feedback, and build brand loyalty. In a highly competitive market, these issues put LK Bakery at a disadvantage against competitors with strong online visibility. To address these challenges, developing a website will enhance brand recognition, improve customer interaction, and facilitate a more efficient ordering process.

1.2 The Business Process

In-Store Purchase

Step 1. Order Placement.

- Customers visit the physical store and order in person.

Step 2. Order Confirmation & Payment

- Payment is made at the counter (cash or digital payment)

Step 3. Order Processing

- Croissants - Customer has an option to reheat the croissants or not
- Drinks - Freshly made upon order

Step 4. Order Handoff

- Dine in - Receive their orders at the counter. Croissants served fresh in a plate.
- Take-out - For orders 4 and more, a custom-made box is used to pack the croissant, and a paper bag for single and a few orders

Online Orders/Grab

Step 1. Order Placement

- Customers order through the Grab app for delivery or message the LK social media pages.

Step 2. Order Confirmation & Payment

- Payment can be made through online transfers, cash-on-delivery, or digital payment platforms.

Step 3. Order Processing

- Pastries and drinks will be prepared and carefully packed to maintain freshness and quality.

Step 4. Order Handoff

- Online orders are handed over to the assigned courier for delivery. While Grab orders are picked up by the Grab rider and delivered to the customer

1.3 Proposed Site Process

LK Bakery emphasized the need to incorporate certain key features such as location, contact information, owner information, product overview, and customer support that cater to both the business and its potential customers. Firstly, a location feature provides visitors with the necessary geographical context, facilitating ease of access and enhancing customer support. Secondly, a display of contact information ensures that customers can effortlessly reach out for inquiries or support, fostering reliability to the business bakery. Third, the owner information feature requested by the manager would allow the bakery to offer a personal touch, allowing customers to have an understanding of the goals that drive the business. Fourth, a detailed product overview feature showcases the menu, helping customers make informed purchasing decisions while highlighting the price of the products. Lastly, having a support feature for addressing customer queries and issues promptly, ensuring satisfaction and encouraging repeat engagement with the business.

To effectively enhance the LK Bakery's current processes, the website is aimed to strategically address key features of improvement according to the manager. The main answer provided was the bakery’s global reach through the website in order to attract a diverse customer base from around the world, significantly expanding the market and increasing sales opportunities. Secondly, by streamlining the process of information dissemination, the website would provide immediate access to details such as product offerings, promotions, and company news, thus simplifying customer engagement and reducing the reliance on traditional advertising methods. Lastly, the integration of a website will allow the business to gather valuable insights into consumer behavior and preferences, enabling more marketing strategies.

1.4 Site's Scope & Limitation

Based on the interview that was conducted, the website's main purpose is to bring knowledge and online presence for LK Bakery. The website is set in order to bring more traffic to the bakery, not only for individuals in Cebu, but also outside of the area and online. The website will focus on features such as Location, Contact Information, About Us, Mission and Vision, and Product Descriptions.

The website will serve as an information or gateway to the bakery itself, providing sufficient information regarding everything the bakery is. This doesn't only limit to the product but also what the business stands for with pages being dedicated to knowing more about the business, the bakery's mission and vision, and also the story behind everything. Since the business already has online operations going on, through Grab, the website doesn't prioritize providing and ordering service and features as this isn't a major concern of the business in its current state.

The website is primarily going to be used by consumers and people interested in the bakery, providing them with an idea of what services and products to expect, also being updated with the menu selection of the business. The website will also provide an avenue for advertisement and being able to update customers with changes that are to come for the bakery.

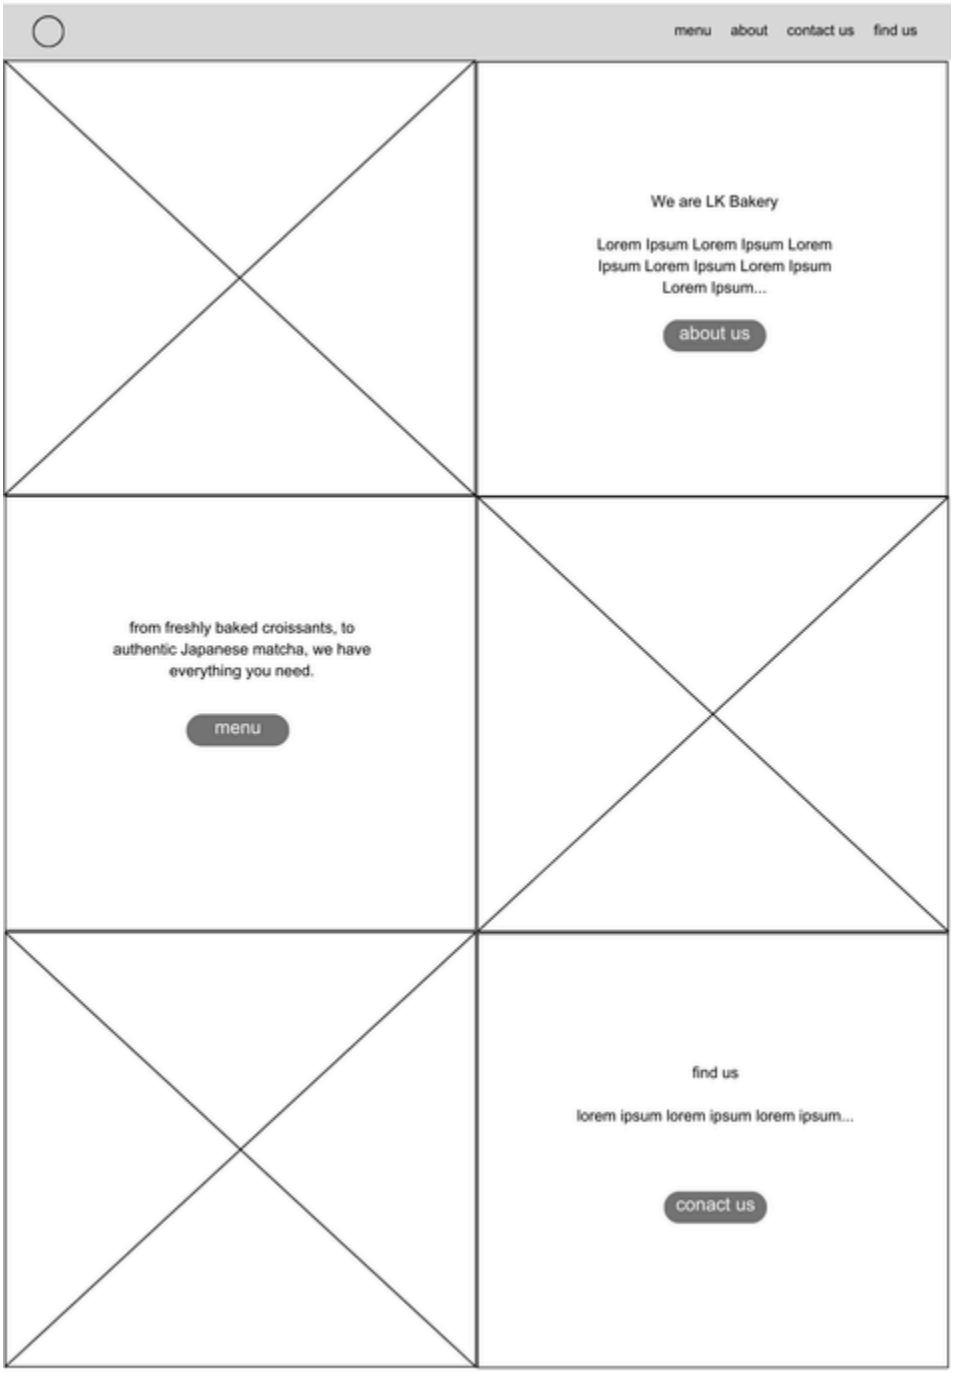

1.5 Recommendation

The proposed system covers a lot of aspects that LK Bakery intends to solve, but with the lack of being able to order might lose them potential customers. With this in mind, we recommend a feature that is able to act upon interest that was created and built by individuals who access the website, and this is in the form of a pseudo-ordering system.

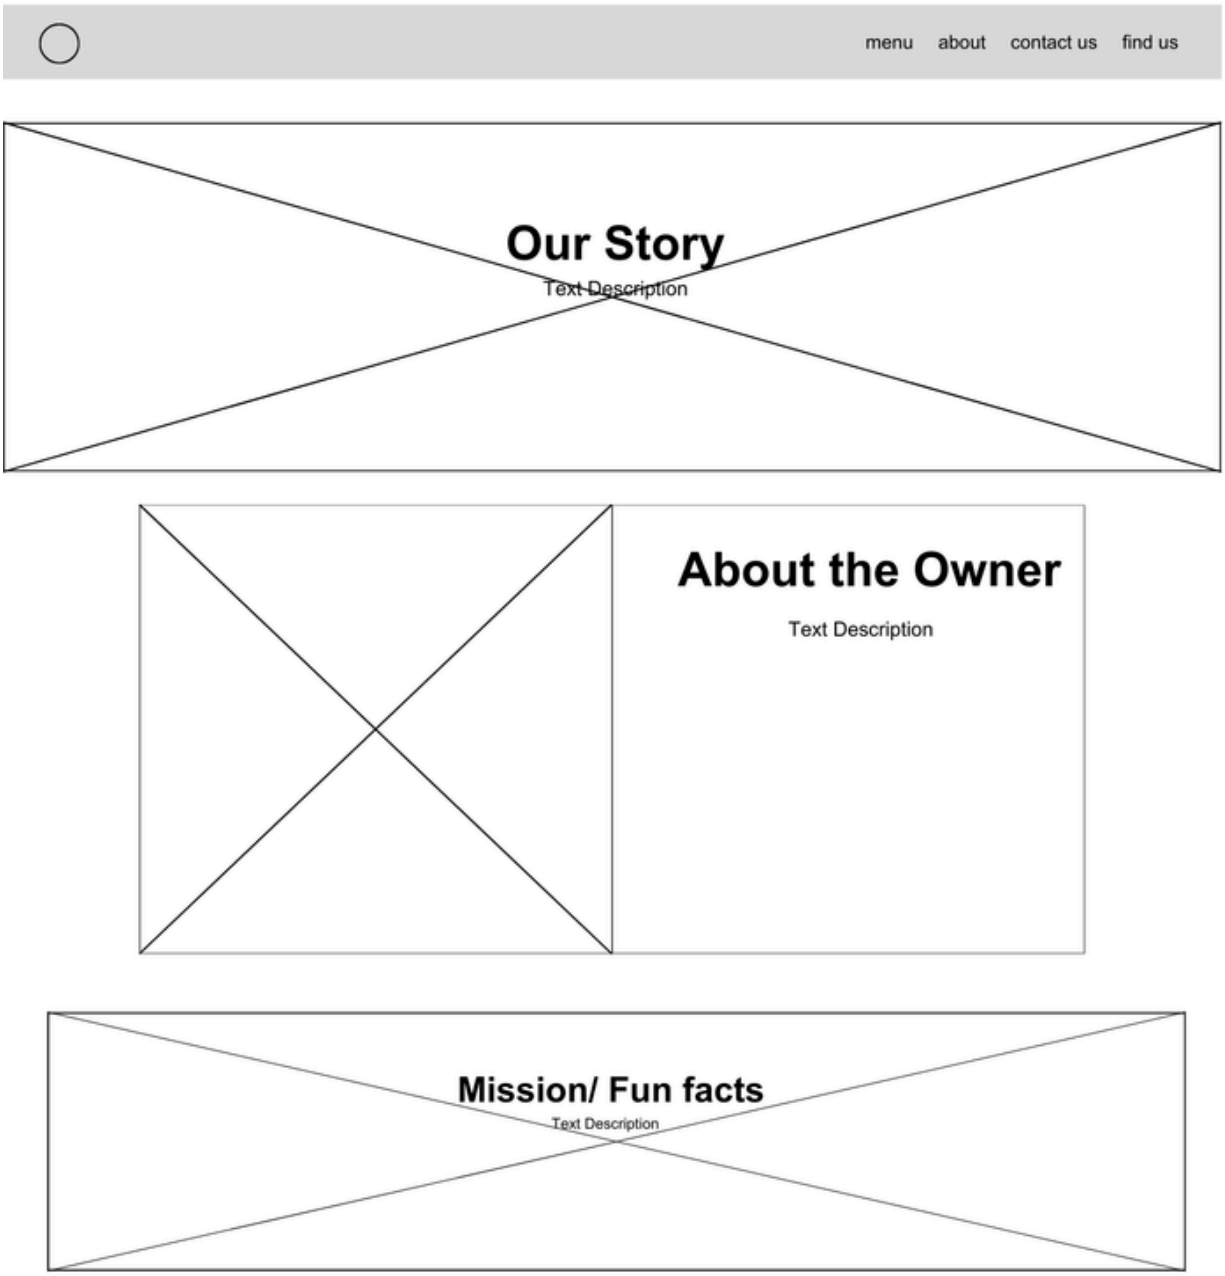

With the website being able to pique the interest of users, it would be good to be able to capitalize on that, by providing a pseudo-ordering system. This system works as an ordering system, but rather than the website taking the order itself, it passes the order to one of its existing order avenues, this being grab and social media. This provides a way for interested customers to order soon after being interested in the bakery from the website, but also relieves the business of extra staff from maintaining orders from another source.
